Linking benefits depend on context and fit measure

Novel focus study · each cell is linking fit minus no-linking fit within the same context.

Blue = higher fit with linking Red = lower fit with linking 0 (tie) = equal fit

Change in correlation

Contexts: better / tied / worse

5 / 0 / 11 5 / 0 / 11 6 / 4 / 6

All three measures use the same 30 equally weighted pairs within each context. Pearson and Spearman use matching aggregation here.

The two correlation panels share a color scale; log score has its own scale. Cell values are rounded; exact ties use tolerance 10^{-12}.

Corrected Qwen2-7B results · saved held-out predictions · Set K = 20 · descriptive differences, without significance or noninferiority tests.
